SUMMARY

Data Scientist with graduate-level Artificial Intelligence training and hands-on experience building reproducible analytical and machine-learning pipelines. Applies point-in-time feature engineering, temporal validation, leakage prevention, model interpretation, and data-quality controls to SaaS, credit-risk, and e-commerce problems.

EDUCATION

FPT School of Business & Technology 2025 – Present
Master of Software Engineering – Artificial Intelligence

FPT University HCMC 2019 – 2024
Bachelor of Artificial Intelligence GPA: 3.0/4.0

PROJECTS

SaaS Product Analytics & Churn Prediction *Python, SQL, DuckDB, Power BI, ML*  [GitHub](#)

- Engineered point-in-time behavioral, billing, support, and account features from 9 relational datasets in DuckDB for a 30-day B2B SaaS churn target.
- Built leakage-controlled XGBoost and LightGBM pipelines with chronological train, validation, and future holdout cohorts, achieving 0.758 test ROC-AUC.
- Translated model outputs into a five-page Power BI decision system using SHAP explanations and expected MRR-at-risk scoring, enabling Customer Success teams to prioritize high-value retention opportunities.

Banking Credit Risk Dashboard *Python, SQL, DuckDB, Power BI, ML*  [GitHub](#)

- Built a memory-efficient data and modeling pipeline for 2.26M loans and 151 source features, including chunked ingestion, validation, feature engineering, and analytical marts.
- Defined a leakage-aware default target from terminal outcomes and used chronological train, validation, and test cohorts, achieving 0.699 holdout ROC-AUC.
- Built a six-page Power BI decision system covering exposure, delinquency, losses, borrower segments, and model monitoring, supporting data-driven underwriting, pricing, collection, and portfolio-risk prioritization.

E-commerce Operations Dashboard *Python, SQL, Power BI*  [GitHub](#)

- Engineered a reproducible analytical model across 4 fact and 6 dimension tables, integrating transactions with simulated return, inventory, channel, and warehouse attributes.
- Developed a five-page Power BI dashboard with SQL-validated KPIs and SKU-level business rules, enabling teams to identify margin leakage, stockout exposure, overstock, and replenishment priorities.

SKILLS

Programming : Python, SQL

Machine Learning : Pandas, NumPy, Scikit-learn, Statistics, EDA, Classification, Feature Engineering, Model Evaluation

Data Engineering : ETL, MySQL, DuckDB, Data Warehouse, Data Cleaning, Data Validation

Tools : Git/GitHub, Docker, Jupyter, Streamlit, Power BI

Languages : Vietnamese (Native), English (Technical Documentation)
